# GradSec: a TEE-based Scheme Against Federated Learning Inference Attacks

ResilientFL, 2021

Workshop on Systems Challenges in Reliable and Secure Federated Learning  $October\ 25^{th}$ , 2021

#### Summary

#### Introduction

State-of-the-art

#### Contributions

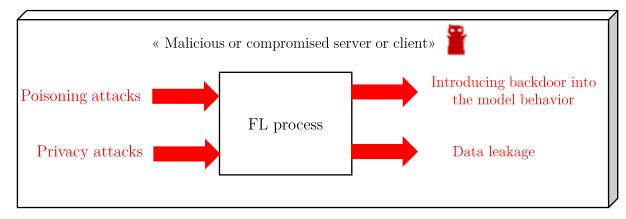

#### Context

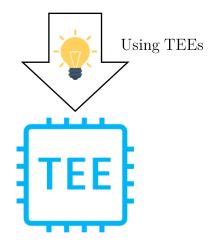

Advent of Federated Learning (FL) to ensure privacy-preserving training

#### Problem

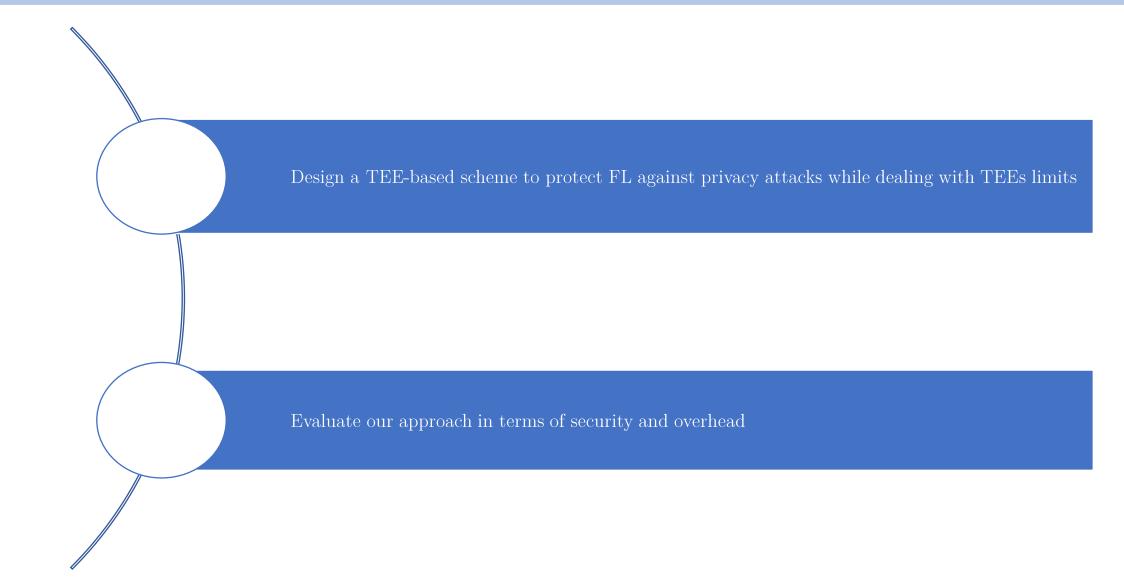

**Problem 1**: FL is vulnerable to many attacks

**Problem 2**: TEEs offer limited secure memory (spatial constraint) and high latency (temporal constraint)

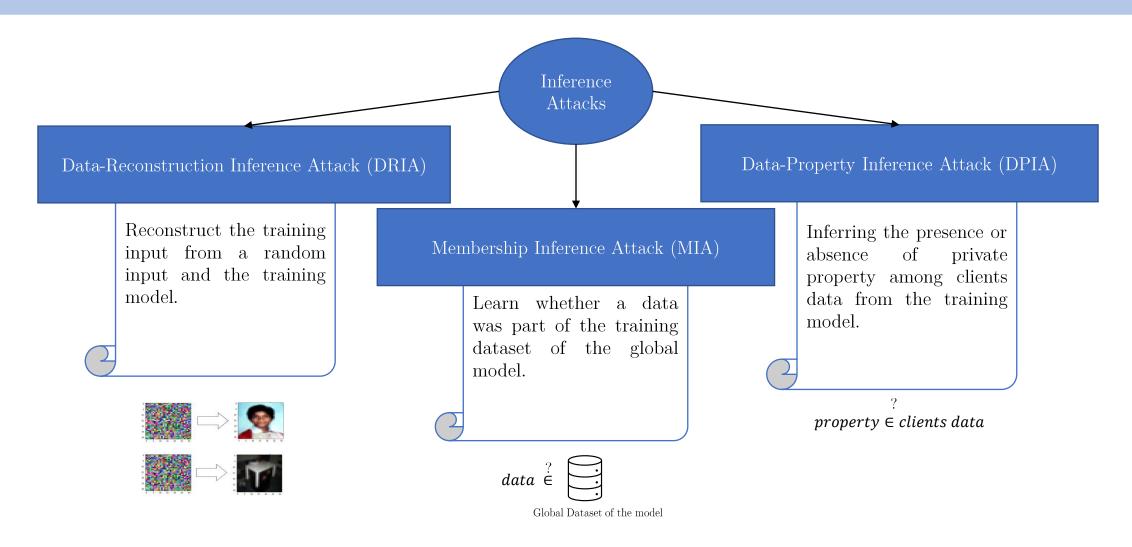

### Objectives

GradSec: a TEE-based Scheme Against Federated Learning Inference Attacks

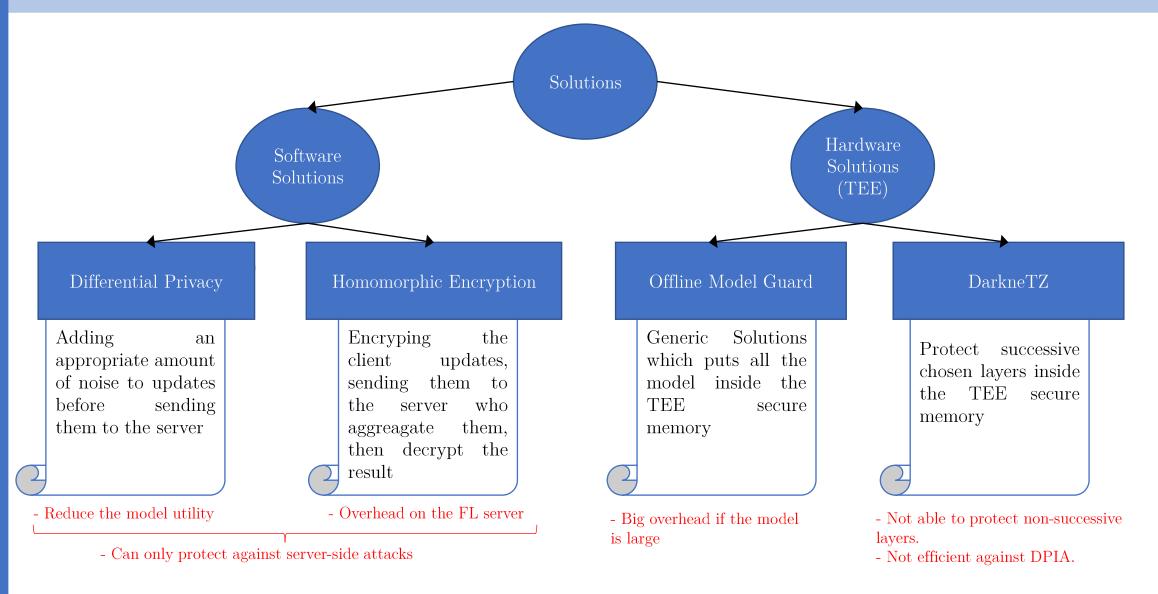

#### Inference Attacks in FL

Common point: The use of gradients emitted by the model to work

#### State-of-the-art approaches

#### Assumptions

- > Securing FL against the most cited Inference Attacks (DRIA, MIA, DPIA).
- > Considering the previous attacks carried out by the clients (the FL server uses Secure Aggregation).
- ➤ The FL models used are exclusively Feed-forward Neural Networks (Fully-connected or Convolutional, no Recurrent).
- ➤ The FL models use Stochastic Gradient Descent Algorithm [8] to update their weights.

### Securing models per layer

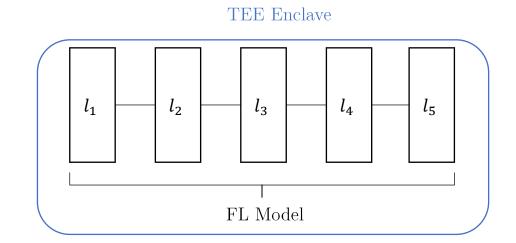

attacker

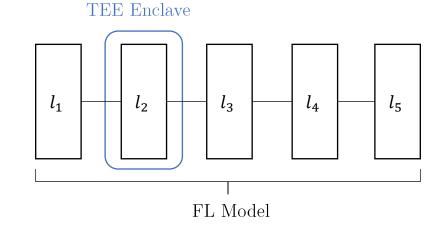

Ideal solution

#### Realistic solution

#### Sources of Gradients leakage of layer l

Source 1: Compute the difference between two consecutive snapshots of the model

Source 2: Backpropagation computation flaw

Formula to update weights model:

$$W_l^{(t+1)} \leftarrow W_l^{(t)} - \lambda \, dW_l$$

Consecutive weights of the model

Gradients deduction

$$dW_l = \frac{W_l^{(t)} - W_l^{(t+1)}}{\lambda}$$

**Solution**: Put  $W_l$  in TEE secure memory

Operation Designation		
	Regular dot product	
$\otimes$	Convolutional dot product	

**Solution :** Secure most important parts of backpropagation computation in the TEE Secure Memory

10

#### Securing Backpropagation using TEEs

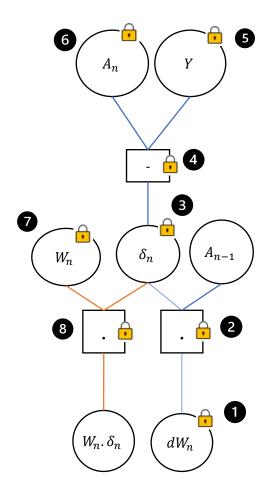

#### Securing last layer (l=n) Gradients

Computation flaw of Gradients

Backpropagation of the error to the previous layer

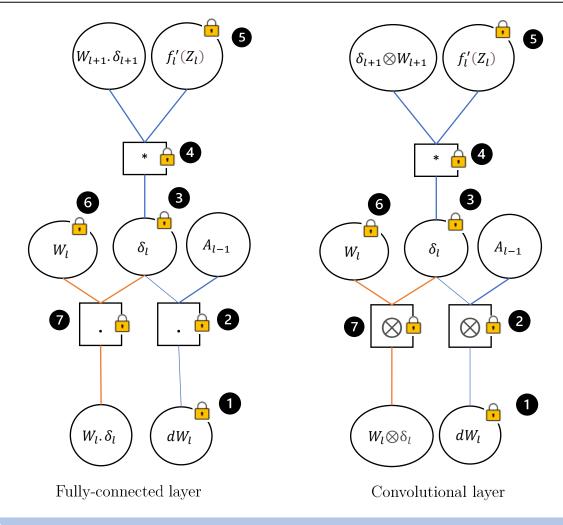

$\begin{array}{c} {\bf Secured} \\ {\bf Data/Operation} \end{array}$	Justification	
0	Represents the Gradients we want to secure	
2	Avoid disclosing $dW_n$ in the cache memory	
3	Avoid the calculation of $dW_n$ thanks to securing $\delta_n$ operand	
4	Avoid disclosing $\delta_n$ in the cache memory	
6	Avoid the computation of $\delta_n$ thanks to securing Y operand	
6	Additional safety measure to avoid the computation of $\delta_n$ if Y is known by the attacker	
•	Avoid source 1 of Gradients leakage to compute $dW_n$	
8	Avoid disclosing $\delta_n$ or $W_n$ in the cache memory	

Operation	Designation
	Regular dot product
*	Hadamard dot product
$\otimes$	Convolutional dot product

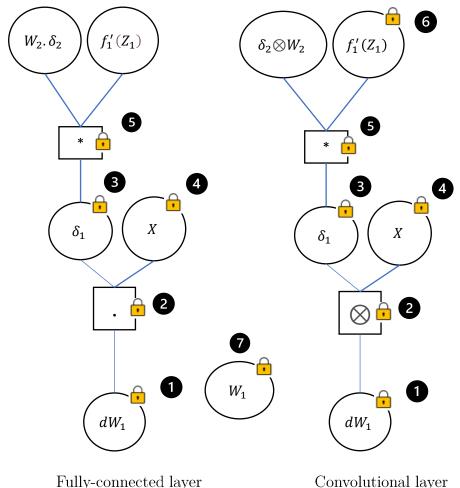

#### Securing Backpropagation using TEEs

#### Securing layer 1 < l < n Gradients

#### Securing Backpropagation using TEEs

#### Securing first layer l = 1 Gradients

# Contributions

#### Static GradSec and Dynamic GradSec

		Static GradSec	Dynamic GradSec	
	Protecting the same layers during all FL cycles  protected_layers: List of protected layers  protected_layers: List of protected layers		Changing the protected layers as the FL cycles through a moving window (MW)	
CLIDULIO			$\gt{size_{MW}}$ : Number of protected layers during each FL cycle $\gt{V_{MW}}$ : Vector of distribution of probability protection	
	Overview	TEE Enclave $Protected\_layers = \{l_2, l_4\}$ $\begin{array}{ c c c c c c c c c c c c c c c c c c c$	TEE Enclave $V_{MW} = [0.3 \ 0.2 \ 0.1 \ 0.4]$ $\begin{array}{c} l_1 \\ l_2 \\ l_3 \\ l_4 \\ l_5 \\ \end{array}$	

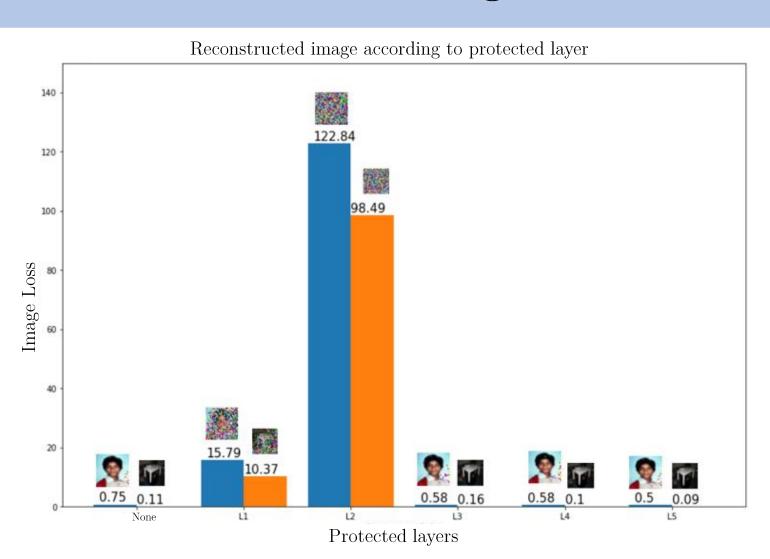

#### Evaluation: Experimental setup

	Metric	Dataset	Model to attack	Protection method
DRIA	Image Loss	CIFAR-100	LeNet-V1 (4 conv2D+ 1 Dense)	Static
MIA				
DPIA	AUC	$\operatorname{LFW}$	LeNet-V2 (3 Conv2D + 2 Dense)	Dynamic

GradSec: a TEE-based Scheme Against Federated Learning Inference Attacks

ResilientFL 10/25/2021

#### Evaluation: GradSec against DRIA

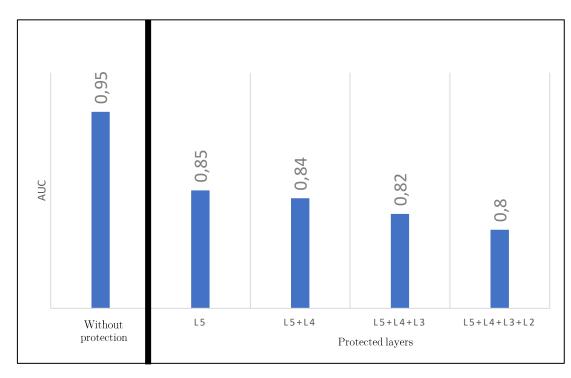

➤ We should protect the L2 layer

#### Evaluation: GradSec against MIA and DPIA

Static GradSec against MIA

Static GradSec and Dynamic GradSec against DPIA

- ➤ The last layer is the most sensitive → layers that contain latent informations necessary to get membership informations [12]
- > Limited interest to protect many layers
- > We should protect only L5 layer

- Protection offered by securing statically 4 layers is equivalent to the protection offered by securing dynamically 2 layers.
- > Dynamic GradSec is more efficient than Static GradSec against DPIA

#### Evaluation: Comparison with DarkneTZ

		$\operatorname{GradSec}$	DarkneTZ	
Protection granularity		Per layer		
Cost of Individual	DRIA	Protecting early layers (2 <sup>nd</sup> )		
Cost of Individual protection against attacks	MIA	Protecting last layers (5 <sup>th</sup> )		
	DPIA	Dynamic GradSec	Protecting 4 layers	
		$(size_{MW} = 2)$	permanently	
Cost for grouped protection		DRIA and MIA $(2^{nd})$	DRIA and MIA $(2^{nd},$	
		$\mathrm{and}\ 5^{\mathrm{th}})$	$3^{\rm rd}$ , $4^{\rm th}$ and $5^{\rm th}$ layer)	

8% more efficient in

grouped protection

16% more efficient

against DPIA
